Avoiding sedentary behaviors requires more cortical resources than avoiding physical activity: An EEG study

Boris Cheval^{1,2,3,4*}, Eda Tipura^{5,6}, Nicolas Burra⁶, Jaromil Frossard^{1,7}, Julien Chana¹, Dan Orsholts⁸, Rémi Radel⁹, Matthieu P. Boisgontier^{1,5,10,11}

ABSTRACT

Why do individuals fail to exercise regularly despite knowledge of the risks associated with physical inactivity? Automatic processes regulating exercise behaviors may partly explain this paradox. Yet, these processes have only been investigated with behavioral outcomes (i.e., based on reaction times). Here, using electro-encephalography, we investigated the cortical activity underlying automatic approach and avoidance tendencies toward stimuli depicting physical activity and sedentary behaviors in 29 young adults who were physically active or physically inactive but with the intention of becoming physically active. Behavioral results showed faster reactions when approaching physical activity compared to sedentary behaviors and when avoiding sedentary behaviors compared to physical activity. These faster reactions were more pronounced in physically active individuals and were associated with changes during sensory integration (earlier onset latency and larger positive deflection of the stimulus-locked lateralized readiness potentials) but not during motor preparation (no effect on the response-locked lateralized readiness potentials). Faster reactions when avoiding sedentary behaviors compared to physical activity were also associated with higher conflict monitoring (larger early and late N1 event-related potentials) and higher inhibition (larger N2 event-related potentials), irrespective of the usual level of physical activity. These results suggest that additional cortical resources were required to counteract an attraction to sedentary behaviors. Data and Materials [<https://doi.org/10.5281/zenodo.1169140>]. Preprint [<https://doi.org/10.1101/277986>].

Abstract

Objective: To analyse data from a trial and report the frequencies with which major and minor errors are detected at a general medical journal; the types of errors missed and the impact of training on error detection.

Design: 817 peer reviewers at the BMJ were randomised to two intervention groups receiving different types of training (face-to-face training or a self-taught package) and a control group. Each reviewer was sent the same three test papers over the study period, each of which had nine major and five minor methodological errors inserted.

Setting: BMJ peer reviewers.

Main outcome measures: The quality of review, assessed using a validated instrument, and the number and type of errors detected before and after training.

Results: The number of major errors detected varied over the three papers. The interventions had small effects. In baseline (paper 1) reviewers found an average of 2.58 of the nine major errors, with no notable difference between the groups. The mean number of errors reported was similar for the second and third papers, 2.71 and 2.6, respectively. Biased randomisation led the error detected most frequently in all three papers, with over 60% of reviewers rejecting the paper identifying this error. Reviewers who did not reject the paper found fewer errors and the proportion finding biased randomisation was less than 40% for each paper.

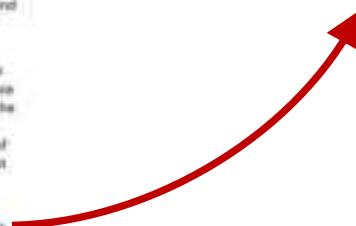

Conclusions: Editors should not assume that reviewers will detect most major errors, particularly those concerned with the context of study. Simple training packages have only a slight impact on improving error detection.

Investigation of energy production by synchrotron, synchrocyclotron and laser radiations in human cancer cells, tissues and tumors and evaluation of their effective on human cancer cells, tissues and tumors treatment trend

Akram Shaker^a* and Kavousi Golami^b

^aFaculty of Sciences, California State University, 14570 Comet St. Dunc, CA 93636, USA

^bIranian Institute for Education of Faizan, Laboratory of Biophysics and Molecular Modeling Groups, Sina Vines de Faizan, Tehran, Iran

Development of synchrotron, synchrocyclotron and LASER radiations increased significantly in human cancer cells, tissues and tumors due to their effects of ablation in the creation of human cancer cells, tissues and tumors treatment trend. The best methods and techniques for destroying human cancer cells, tissues and tumors to investigation of energy production by synchrotron, synchrocyclotron and LASER radiations in human cancer cells, tissues and tumors and evaluation of their effects on human cancer cells, tissues and tumors treatment trend. To achieve this goal, according to the results by factors in the previous study as pH, temperature and treatment time, among the systems used for this purpose, single-stage systems under synchrotron, synchrocyclotron and LASER radiations possess highest efficiency. In the consecutive process of the system, human lung cancer cells, tissues and tumors were produced with efficiency 99% or total. Efficiency 99% was obtained after applying of synchrotron, synchrocyclotron and LASER radiations for malignant human cancer cells, tissues and tumors under synchrotron, synchrocyclotron and LASER radiations for transformation process in foreign human cancer cells, tissues and tumors with the passage of time [1-21].

Replying to @CostinAntonescu

Please, please, please do not write that trainee's paper is good because it is in a journal(s) with X.XX impact factor. If published in a field-specific journal, DO state if and how journal is well-regarded in that particular field.

8. Évaluer la qualité scientifique

Améliorer les méthodes d'évaluation de la recherche et des chercheurs.

**Evaluez l'impact de la science,
pas du journal.**

9. Est-ce stratégique d'être un « Open Scientist »

C'est quoi être un « scientifique ouvert » ?

Vous n'êtes **pas obligé de faire de la science ouverte tout le temps**. L'important c'est de **connaître les options** qui sont disponibles et de les utiliser lorsque cela est possible.

Si vous avez déjà partagé des données, du code, preprinté, « préinscrit » votre protocole **ou** rendu des documents de recherche disponibles gratuitement, vous êtes un « open scientist ».

Recrutement

The screenshot shows a job listing for a tenure-track position in health psychology at the University of British Columbia-Vancouver campus. The listing includes the following details:

- Desired Start Date: 2019/07/01
- Funding Type: Budget Funded
- Closing Date: 2018/10/01
- Available Openings: 1

Buttons at the bottom include "Save Job", "Apply Now", and "Return to Previous Page".

The Department of Psychology at the University of British Columbia-Vancouver campus (psych.ubc.ca) invites applications for a tenure-track position at the assistant professor level in health psychology, which will begin July 1, 2019.

Candidates must hold a PhD before starting the position.

We are seeking applicants with strong research records appropriate to a research-oriented doctoral program. We are looking for outstanding health psychology candidates, regardless of research specialization, but we are especially interested in candidates whose research focuses on biopsychosocial processes in health and disease, and/or health behaviors. Applicants should have research interests that complement existing strengths in the department (psych.ubc.ca/faculty/index.php). The successful candidate will be expected to maintain a program of scholarly research that leads to publication, conduct effective undergraduate and graduate teaching and research supervision, and contribute to departmental service.

Applications are to be submitted online through the UBC Faculty Careers website at www.facultycareers.ubc.ca. Applicants should upload by the deadline the following documents in the order listed: cover letter, CV, research statement, teaching statement, evidence of teaching effectiveness, and 3 publications. In their research statement, we encourage applicants to discuss

their past and/or planned research approach in the context of ongoing discussion in the sciences about research practices, replicability, and open science. In addition, applicants should arrange to have at least three confidential letters of recommendation submitted via email to utccpsych@psych.ubc.ca.

“We encourage applicants to discuss their past and/or planned **research approach** in the context of ongoing discussion in the sciences about **research practices, replicability, and open science**”
